It is an important part of the design process to understand what is possible. When you are working on a design, you should always ask yourself: "What can I do?" and "What can't I do?" This is a good way to keep your design realistic and to avoid frustration. You should also ask yourself: "What are the constraints?" and "What are the opportunities?" This is a good way to keep your design focused and to avoid getting lost in the details.

Another important part of the design process is to understand the needs of the user. You should always ask yourself: "What does the user need?" and "How can I meet that need?" This is a good way to keep your design user-centered and to avoid creating a design that is not useful to the user.

Finally, it is important to understand the context of the design. You should always ask yourself: "What is the context?" and "How does the design fit into that context?" This is a good way to keep your design relevant and to avoid creating a design that is out of place.

By following these steps, you can ensure that your design is realistic, user-centered, and relevant. This is a good way to keep your design on track and to avoid frustration.
